

SUPPLEMENTAL DATA

SUPPLEMENTAL FIGURES

Figure S1. Importance of the P5 peptide residue in T cell polyclonal response. Removal of the P5 side chain for both 2.5mi 9Q (left) and HEL₁₁₋₂₇ (right) peptides results in loss of reactivity. Mice were immunized with either 2.5mi 9Q or HEL₁₁₋₂₇ peptides (5 µg of peptide+CFA). Draining lymph nodes were harvested at day 8, and CD4⁺ T cells were purified by magnetic sorting and used for proliferation against increasing doses of the immunizing peptide or variants bearing Gly P5 in the presence of irradiated splenocytes. Identification: 2.5mi 9Q peptide (closed circles), 2.5mi 5G 9Q peptide (closed squares), HEL₁₁₋₂₇ peptide (open triangles), HEL₁₁₋₂₇ 5G peptide (open squares). Values are the mean of duplicates.

Figure S1.

T cell hybridomas were isolated after immunization with GAD₂₂₁₋₂₃₅ or GAD₂₂₁₋₂₃₅9E peptides. Negatively charged amino acid residues in the first part of the CDR3 β segment are highlighted in bold and red. Vb del: deletion of nucleotide(s) on 3' part of BV germline, add*: addition of nucleotide(s) between BV and BD, D5' del: deletion of nucleotide(s) on 5' part of BD germline, D3' del: deletion of nucleotide(s) on 3' part of BD germline, add**: addition of nucleotide(s) between BD and BJ, Jb del: deletion of nucleotide(s) on 5' part of BJ germline ✓: deletion or addition of nucleotide(s), -: no deletion or no addition, ✗: deletion or addition of nucleotide(s) responsible for the coding of a negatively-charged residue in the first part of CDR3 β . The amino acid sequences after "CTC" in TRBV1, "LCG" in TRBV20, "CAW" in TRBV31, or "CAS" in all other TRBVs and before "YF", "FF" "TF" or "LF" in TRBJs were defined as CDR3 β . The N-terminal region of CDR3 β was defined as the first half of CDR3 β .

Individual T cells sorted after tetramer labeling were used for RT-PCR and sequencing. Negatively charged amino acid residues in the first part of the CDR3 β segment are highlighted in bold and red. Vb del: deletion of nucleotide(s)

on 3' part of BV germline, add*: addition of nucleotide(s) between BV and BD, D5' del: deletion of nucleotide(s) on 5' part of BD germline, D3' del: deletion of nucleotide(s) on 3' part of BD germline, add**: addition of nucleotide(s) between BD and BJ, Jb del: deletion of nucleotide(s) on 5' part of BJ germline ✓: deletion or addition of nucleotide(s), -: no deletion or no addition, ✓: deletion or addition of nucleotide(s) responsible for the coding of a negatively-charged residue in the first part of CDR3 β . The amino acid sequences after “CTC” in TRBV1, “LCG” in TRBV20, “CAW” in TRBV31, or “CAS” in all other TRBVs and before “YF”, “FF” “TF” or “LF” in TRBJs were defined as CDR3 β . The N-terminal region of CDR3 β was defined as the first half of CDR3 β .

.

Table S7. Data collection and refinement statistics for I-A⁹⁷GAD₂₂₁₋₂₃₅

Data processing	
Resolution range (Å)	38.45- 3.09 (3.15- 3.09)
Unique reflections	10,586 (509)
Completeness (%)	98.7 (99.4)
Redundancy	4.9
^a R_{sym} (%)	12.8 (68.2)
Average $\ /\sigma(l)\ $	10.6 (1.8)
Refinement	
Reflections	10,023
Reflections(test)	563
^b R_{cryst} (%)	23.2 (28.7) ^c
^d R_{free} (%)	28.6 (31.2)
Residues/protein atoms	358/2924
^e Coordinate error (Å)	0.41
rmsd bonds/angles (Å/deg.)	0.003/0.638
Average B values(Å ²)	
I-A ⁹⁷	73.5
Peptide GAD ₂₂₁₋₂₃₅	67.4
^f Ramachandran statistics (%)	
Most favored	87.3
Additionally allowed	12.1
Generously allowed	0.3
Disallowed	0.3

Values in parentheses refer to the highest resolution shell.

^a $R_{\text{sym}} = 100 \sum_h \sum_i |I_i(h) - \langle I(h) \rangle| / \sum_h I(h)$ where $I_i(h)$ is the i th measurement of the h reflection and $\langle I(h) \rangle$ is the average value of the reflection intensity.

^b $R_{\text{cryst}} = \sum ||F_o|| - ||F_c|| / \sum ||F_o||$, where F_o and F_c are the observed and calculated structure factor amplitudes within the set of reflections used for refinement.

^cShell resolution 3.4 - 3.1 Å.

^dR_{free} = Σ|F_o| - |F_c| / Σ|F_o| calculated for a randomly selected set of structure factors (~5%) throughout the resolution range and not used in refinement.

^eValues are based on maximum likelihood.

^fThe Ramachandran plot was generated with PROCHECK.

Table S8. Data collection and refinement statistics for TCR 21.30/I-A^{g7}HEL₁₁₋₂₇

Data processing	
Resolution range (Å)	48.26 - 2.88 (2.98 - 2.88)
Unique reflections	43435 (1590)
Completeness (%)	68.9 (26.4)
Redundancy	1.99
^a R _{sym} (%)	11.2 (43.2)
Average I/σ(I)	13.0 (0.98)
Refinement	
Reflections	34208
Reflections (test)	727
^b R _{cryst} (%)	25.3 (37.3) ^c
^d R _{free} (%)	28.1 (42.1)
Residues/protein atoms	1614/12944
^e Coordinate error (Å)	0.54
rmsd bonds/angles (Å / deg.)	0.007/1.002
^f Average B values (Å ²)	
Monomer 1 (chains A,B,C,D,P)	
TCR 21.30	51
I-A ^{g7} HEL ₁₁₋₂₇	53
Monomer 2 (chains E,F,G,H,Q)	
TCR 21.30	95
I-A ^{g7} HEL ₁₁₋₂₇	89
^g Ramachandran statistics (%)	
Most favored	76.9
Additionally allowed	21.5
Generously allowed	1.4
Disallowed	0.1

Values in parentheses refer to the highest resolution shell.

^aR_{sym} = 100 $\sum_h \sum_i |I_i(h) - \langle I(h) \rangle| / \sum_h I(h)$ where $I_i(h)$ is the i th measurement of the h reflection and $\langle I(h) \rangle$ is the average value of the reflection intensity.

^b $R_{\text{cryst}} = \Sigma ||F_o| - |F_c|| / \Sigma |F_o|$, where F_o and F_c are the observed and calculated structure factor amplitudes within the set of reflections used for refinement.

^cShell resolution 3.11 - 2.88Å.

^d $R_{\text{free}} = \Sigma ||F_o| - |F_c|| / \Sigma |F_o|$ calculated for a randomly selected set of structure factors (~2%) throughout the resolution range and not used in refinement.

^eValues are based on maximum likelihood.

^fAverage B values include TLS contributions. Significantly higher B values (>120 Å²) were obtained using the original data prior to anisotropic correction.

^gThe Ramachandran plot was generated with PROCHECK.
